TITLE : COIL HOLDING STRUCTURE FOR
MOTOR AND DOUBLE ROTOR TYPE
MOTOR USING THE SAME
STRUCTURE

ABSTRACT : PURPOSE: To reduce the thicknesses of the coil and coil holding member of a motor by forming a plurality of insertion parts to be inserted with coils at the member substantially concentrically with the axial center of a rotational shaft, and inserting coils into the insertion parts.

CONSTITUTION: A coil holding member 16 is wholly formed in a disc, and has an axial hole 16A at the center to be engaged with a bearing and insertion parts for holding coils concentrically at the axial hole as the center. Coils are inserted into the coil insertion parts of the member 16. The thicknesses of the coil and the member 16 are suppressed to the thickness of the member 16 by inserting the coils into the insertion parts of the member, thereby reducing the thickness of a motor section.
